

TRU Waste Reduced at 233-S Plutonium Facility

Aerial view of 233-S Plutonium Concentration Facility prior to start of demolition (October 2003).

View of characterization sampling points established on interior wall and ceiling surfaces of the 233-S Process Hood. Characterization data was used for designation of demolition debris as Low-Level Waste -vs- TRU Waste. A hydraulic man-lift enabled workers to access sampling points.

D&D workers making initial saw cuts on 233-S Process Hood roof. Roof and walls were cut into large panel sections, then lowered to the ground by a crane.

Aerial view of 233-S site after demolition, debris removal/disposal, and placement of grout and soil cover (June 2004).
